Subject: Linux Shell Scripting Exercise

To help automate disaster recovery, write a script for testing on the Centos and Debian server so that it will query relevant system information from the file system, the uname command, the output of dmesg and any other sources on the system you deem relevant for monitoring. The script should collect this information in variables, format it, then store it in a text file. Run the script then post it on the Blue Team site (inject portal) for evaluation.

Thank you.

Felonius Gru
