**Subject:** Use NetStat to determine outgoing connections

I received another phone call from our ISP. Their own security engineers are concerned about some outgoing network traffic. They have suggested using the netstat tool to generate a report of outgoing connections for ports 21, 22, 23, 80, 443 and 445. Please do this on each one of your workstations and verify all the outgoing connections are legitimate. If not, note the unknown outgoing traffic and your course of action. I would appreciate if this can be in a report. Please have 1 page or section for each box.

Make sure to include the full netstat output for each box and an explanation for any outgoing traffic you don't recognize. Note the Ports were suggestions only. Feel free to add any additional ports you feel should be included.

Thank you.
